---

NUEVA GENERACIÓN DE BROCCAS DE METAL DURO

---

---

# MINI-MVS

---

IDEAL PARA CONSEGUIR UNA LARGA VIDA ÚTIL DE LA HERRAMIENTA Y UNA MAYOR SEGURIDAD DURANTE UN TALADRADO PROFUNDO.

---

**FILO DE CORTE RECTO**

Mejor evacuación de la viruta y resistencia del filo de corte.

**NUEVA GEOMETRÍA DE HÉLICE**

Para una mejor evacuación de la virutas.

**DOBLE MARGEN**

Proporciona un corte equilibrado y de alta precisión.

# MINI-MVS

## RESULTADOS DE CORTE

### VIRUTAS FINAS Y UNIFORMES

- Filo de corte recto que combina una mejora en la evacuación de las virutas y en la resistencia del propio filo de corte.
- El margen simple permite alcanzar un equilibrio óptimo y una gran precisión en el taladrado de diámetros pequeños.

\* 2 = Broca para el agujero guía. Profundidad del agujero de DCx2.

# GUÍA OPERACIONAL

## INSTRUCCIONES OPERATIVAS PARA LA BROCA LARGA MINI-MVS (L/D > 10)

### TALADRADO DE CARA PLANA TALADRADO DE AGUJERO GUÍA

#### 1. Taladrado de un agujero previo.

1. Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
2. Asegúrese de taladrar un agujero de alta precisión como guía.
3. Profundidad del taladrado: Aprox. 1DC o mayor.  
[Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo].

#### 2. El corte inicial con la broca de tipo largo

1. Realice el agujero guía a bajas revoluciones.  
[Revoluciones a 1000 min<sup>-1</sup>, vel. avance: 0.2 mm – 0.3 mm/rev]
2. Detenga la broca larga a 0.5 – 1 mm del extremo inferior del agujero guía.

#### 3. Taladrado del agujero profundo

1. Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

#### 4. Retracción de la broca

1. Una vez taladrado, reduzca las revoluciones de corte aprox. a 0.5 – 1 mm. del extremo del agujero.  
[Revoluciones en torno a 1000 min<sup>-1</sup>]
2. Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de 3000 mm/min.
3. Finalmente limpie el agujero con una velocidad de corte de 20 – 30 m/min. y una velocidad de avance de 0.2 – 0.3 mm/rev.

# GUÍA OPERACIONAL

## INSTRUCCIONES OPERATIVAS PARA LA BROCA LARGA MINI-MVS (L/D > 10)

### TALADRADO INTERRUMPIDO

### TALADRADO E INSERCIÓN EN CARAS O ÁNGULOS IRREGULARES.

#### 1. Refrentado

1. Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

#### 2. Taladrado de un agujero previo.

1. Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
2. Asegúrese de taladrar un agujero de alta precisión como guía.
3. Profundidad del taladrado: Aprox. 1DC o mayor. (Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

#### 3. El corte inicial con la broca de tipo largo

1. Efectúe el agujero guía a bajas revoluciones. (Revoluciones a  $1000 \text{ min}^{-1}$  vel. avance:  $0.2 \text{ mm} - 0.3 \text{ mm/rev}$ )
2. Detenga la broca larga a  $0.5 - 1 \text{ mm}$  del extremo inferior del agujero guía.

#### 4. Taladrado del agujero profundo

1. Comience a cortar a la velocidad y avance recomendados con un ciclo sin perforación (avance continuo).

#### 5. Inserción

1. Durante la inserción, el filo de corte puede resultar dañado
2. Disminuya la velocidad de avance durante la inserción de la broca.

#### 6. Retracción de la broca

1. Finalmente limpie el agujero con una velocidad de corte de  $20 - 30 \text{ m/min}$ . y una velocidad de avance de  $0.2 - 0.3 \text{ mm/rev}$ .
2. Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3000 \text{ mm/min}$ .
