

# HERRAMIENTAS DE TALADRADO

# MITSUBISHI MATERIALS

## CATÁLOGO GENERAL C010 2025 – 2027

### ESPECÍFICO, COMPACTO, PRÁCTICO.

Los productos de Mitsubishi Materials se mostrarán ahora en catálogos individuales, divididos por gamas de productos para ofrecer a los usuarios un acceso rápido y fácil a la información de los productos que necesiten.

El nuevo catálogo se comprende en los siguientes cinco volúmenes:

- HERRAMIENTAS DE TORNEADO
- TALADRADO
- FRESADO INTEGRAL
- FRESADO CON PLACAS INTERCAMBIABLES
- MPLUS

MANEJO SENCILLO

MAYOR FLEXIBILIDAD

ÁREAS DE APLICACIÓN INDIVIDUALES

La caja nos permite un fácil almacenamiento y ofrece un espacio para que pueda añadir los próximos catálogos complementarios, incluidas las novedades que se publicarán dentro de los 2 años de vigencia del catálogo general. Cada catálogo/folleto de novedades sustituirá la versión anterior, por lo tanto, puede reemplazar las versiones antiguas cuando se suministren los nuevos catálogos para garantizar la actualización.

### NOTAS:

- Con esta publicación, todos los catálogos generales y catálogos/folletos de novedades anteriores pierden su validez.
- Los catálogos/folletos de novedades de productos se publican dos veces al año, en abril y en octubre.
- El nuevo catálogo general se puede solicitar solo como un conjunto de cinco. **Número de pedido: C010S**

### VERSIÓN DIGITAL

# HERRAMIENTAS DE TALADRADO

A close-up photograph of a drill bit, illuminated with a strong red light. The image is overlaid with white geometric lines that create a dynamic, angular composition. The background is dark, making the red and white elements stand out.

## **RENDIMIENTO: REDEFINICIÓN DE LOS PARÁMETROS**

La industria de fabricación moderna avanza con rapidez, por lo que Mitsubishi Materials se esfuerza continuamente por mantenerse al día en el mercado.

En contacto constante con nuestros socios y clientes, ofrecemos soluciones para cualquier situación.

Desde la broca de placa intercambiable MVX para agujeros con una profundidad de hasta  $6 \times D$ , hasta la MPS1 de gran profundidad, Mitsubishi Materials cuenta con soluciones individuales para todas las aplicaciones de taladrado.

# COMO INTERPRETAR LA PÁGINA ESTÁNDAR DE BROCAS

- Como está organizada esta página
- ① Organizada según aplicación para cada broca.

**FOTO DE PRODUCTO**  
**TÍTULO DE PRODUCTO**  
**TIPO DE PRODUCTO**

**MPS1**  
 ● Nuevo recubrimiento de PVD basado en AlTiCN.  
 La broca MPS1 tiene 4 aristas para precisión y fabricación de la broca.

● Broca extra larga de doble margen

35DCS6 35DCS10 35DCS16 35DCS20

DIN / PC: +0.020 / -0.020, +0.025 / -0.025, +0.030 / -0.030, +0.035 / -0.035  
 L: C: 0.012 / -0.015, 0.018 / -0.021, 0.024 / -0.027, 0.030 / -0.033  
 L: C: 0.008 / -0.009, 0.011 / -0.013

Refrigeración interna

● Tipo 1 Tipo mango cilíndrico con cuello cónico  
 ● Tipo 2 Tipo mango cilíndrico  
 ● Tipo 3 Mango tipo Whistle notch con cuello cónico  
 ● Tipo 4 Mango tipo Whistle notch

# DESCRIPCIONES DE LOS SÍMBOLOS

## Material

### Metal duro de ultra micro-grano

El metal duro de ultra-micrograno se utiliza para las herramientas de corte.

### HSS de aleación de alto grado

La HSS de aleación de alto grado se utiliza para las herramientas de corte.

### Acero rápido

El acero rápido se utiliza como material de sustrato.

## Núcleo de la broca

### Reducción del alma X

La reducción del alma X se utiliza en el filo de corte de la broca.

### Reducción del alma Z

La reducción del alma Z se utiliza en el filo de corte de la broca.

### Reducción del alma XR

La reducción del alma XR se utiliza en el filo de corte de la broca.

### Reducción del alma N

La reducción del alma N se utiliza en el filo de corte de la broca.

## Tolerancia

### Tolerancia del diámetro de la broca

### Tolerancia del diámetro del mango

## Agujero de refrigeración

### Con agujero de refrigeración

## Rango de aplicación según el material de trabajo

### 1ª Recomendación

### No recomendada

## Recubrimiento

### Recubrimiento MIRACLE

Recubrimiento original (Al,Ti)N. También apto para corte seco.

### Recubrimiento PVD

DP102A es una calidad de metal duro convencional recubierto por PVD especializado para brocas de diámetro pequeño, con una resistencia al desgaste mejorada.

### Recubrimiento PVD

Ofrece una excelente resistencia al desgaste con un amplio rango de materiales de trabajo; acero, materiales a base de hierro fundido y aleaciones de aluminio.

### Recubrimiento PVD

Metal duro convencional de ultramicrograno óptimo para acero inoxidable, y un recubrimiento por PVD con una excelente resistencia al calor y lubricidad.

### Recubrimiento PVD

DP9020 ofrece alta resistencia al desgaste y a la rotura, por lo que ofrece una larga vida útil de la herramienta.

### Recubrimiento VIOLET

Prolonga la vida de la herramienta 2 o 3 veces más que los productos con recubrimiento TiN.

### Recubrimiento de diamante CVD

La tecnología exclusiva multigrano y multicapa de control de cristal de diamante mejora drásticamente la resistencia al desgaste y la suavidad.

## Ángulo de filo de corte

### Ángulo de la punta

Indica el ángulo de la broca en la punta.

Nota 1) Cuando taladramos agujeros desde 0.3 mm se recomienda el uso de una broca punteadora.

Nota 2) Cambiar las condiciones de corte dependiendo de la maquina y de la rigidez del material.

Nota 3) Cuando taladramos agujeros por encima de DCx5, reducir las condiciones.

Nota 4) Se recomienda el uso de refrigerante hidrosoluble en agua (diluido 20 veces) para taladrado utilizando las condiciones de arriba.  
Bajar las revoluciones si se utiliza otro tipo de refrigerante.

Nota 5) Para mecanizar los materiales marcados con "\_" usando las condiciones de la tabla de arriba se recomienda NO utilizar refrigeración interna.

# TALADRADO (METAL DURO INTEGRAL)

CARBURO  
(METAL DURO)

# MSE

- Ancho de la hélice para prevenir la aglomeración de virutas.
- Estable, pequeños diámetros de mecanizado.

Nota 1) Cuando taladramos agujeros desde 0.3 mm se recomienda el uso de una broca punteadora.

Nota 2) Cambiar las condiciones de corte dependiendo de la maquina y de la rigidez del material.

Nota 3) Cuando taladramos agujeros por encima de DCx5, reducir las condiciones.

Nota 4) Se recomienda el uso de fluido soluble en agua (diluido 20 veces) para taladrado utilizando las condiciones de arriba.  
Bajar las revoluciones si se utiliza otro tipo de refrigerante.

Nota 5) El material a trabajar marcado por "\_" en las condiciones de la tabla de arriba, será complicado taladrarlo con refrigeración interna.  
Se recomienda la refrigeración interna en MWS y VAPDSSUS.

Nota 1) El diámetro de centrado debe ser menor que el diámetro de la broca (diámetro de procesamiento) **DC** y la longitud útil **LU** debe utilizarse a modo de guía.

**M**

TALADRADO

### SELECCIÓN DEL DIÁMETRO DE LA BROCA

#### PARA REALIZAR EL BISELADO

Seleccione el diámetro de la broca (diámetro de corte) **DC** en relación con el diámetro del agujero guía **D**, dentro de un rango de  $D < DC < 2D$ .

M

TALADRADO

Ejemplo) Si el diámetro del agujero guía **D** es de 5 mm: el diámetro de la broca **DC** debe ser igual o mayor de 6 mm pero menor de 10 mm. Seleccione un **DC** de 6 mm, 7 mm u 8 mm.

**Si DC es igual o mayor que 2D:**

Si el diámetro de broca **DC** es demasiado grande comparado con el diámetro del agujero guía **D** (igual o mayor que **2D**), no podrá realizarse el biselado.

**Si DC es igual a D:**

No puede realizarse el biselado si el diámetro de la broca **DC** es igual al diámetro del agujero guía **D**.

#### PARA REALIZAR EL CENTRADO

El diámetro de centrado debe ser menor que el diámetro de la broca (diámetro de procesamiento) **DC** y la longitud útil **LU** debe utilizarse a modo de guía.

El área central de agujeros (aprox. 25 % del diámetro completo) formada por ángulos de punta de dos pasos no tendrá sus respectivos ángulos de  $60^\circ$  y  $90^\circ$ . El biselado tampoco es posible en las áreas centrales.

Seleccione una broca de centrado con un ángulo de punta más grande que el de la broca de agujero final si desea hacer contacto inicial con el centro.

Centrado del ángulo de la punta SIG  $145^\circ$

Nota 1) Utilice una herramienta más grande (DC) que el agujero central requerido, pero inferior a 2 x DC.

Nota 2) Reduzca la velocidad de avance cuando taladre en superficies en curva o inclinadas.

Nota 3) Reduzca las condiciones de corte cuando realice un ranurado en V o el biselado del borde.

Nota 4) Cuando se generen vibraciones de traqueteo o ruido anómalo, acorte el tiempo de permanencia o reduzca las revoluciones.

Nota 5) Al realizar el centrado, no supere la LU (longitud útil).

2.95	$\leq 2$	11600	0.060 (0.040–0.090)

Nota 1) La profundidad recomendada del agujero es  $DC \times 2$ . Esta debería ser la profundidad desde la superficie superior del material de trabajo cuando se trabaje sobre superficies con ángulo. (Consulte el diagrama)

Nota 2) En la tabla de corte anterior se da por hecho que se taladra en una superficie plana.

Para taladrar en superficies en ángulos, ajuste la velocidad de avance de acuerdo con el ángulo de inclinación.

Si el ángulo de inclinación  $\alpha$  es de  $30^\circ$  o menos, ajuste la velocidad de avance al 70 % o menos como guía.

Si el ángulo de inclinación  $\alpha$  es mayor de  $30^\circ$ , ajuste la velocidad de avance al 50 % o menos como guía.

Nota 3) Este producto es una herramienta diseñada para taladrar. Se recomienda su uso sólo para procesos de taladrado.

Nota 1) La profundidad recomendada del agujero es DCx3. Esta debería ser la profundidad desde la superficie superior del material de trabajo cuando se trabaje sobre superficies con ángulo. (Consulte el diagrama)

Nota 2) En la tabla de corte anterior se da por hecho que se taladra en una superficie plana.

Para taladrar en superficies en ángulo, ajuste la velocidad de avance de acuerdo con el ángulo de inclinación.

Si el ángulo de inclinación  $\alpha$  es de  $30^\circ$  o menos, reduzca la velocidad de avance al 30% o más como guía.

Si el ángulo de inclinación  $\alpha$  es mayor de  $30^\circ$ , reduzca la velocidad de avance al 50% o más como guía.

Nota 3) Para el mecanizado de superficies planas de acero inoxidable, taladre primero un agujero piloto con el mismo diámetro o haga un avellanado.

Nota 4) Este producto es una herramienta diseñada para taladrar agujeros. Se recomienda su uso sólo para procesos de taladrado.

Nota 1) Las condiciones de corte anteriores reflejan el uso de refrigerante hidrosoluble. En el caso del acero inoxidable, se recomienda el uso de refrigerante no hidrosoluble.

Nota 2) Cuando utilice un refrigerante no hidrosoluble, reduzca la velocidad de corte en un 20 % para garantizar una lubricación adecuada.

Nota 3) Compruebe el estado de las virutas y realice el mecanizado por pasos si es necesario. \* Referencia de la longitud del paso: de 0.2 a 1.0 DC

Nota 4) Ajuste las condiciones de corte en función de la máquina-herramienta, así como la rigidez de sujeción de la pieza de trabajo, la geometría de mecanizado, etc.

Nota 5) No se recomienda mecanizar a profundidades que excedan la longitud de la hélice (LU).

Nota 6) Sujete la broca de tal forma que el salto radial de la misma no supere los 0.03 mm.

Nota 7) No amarre la parte de la hélice de la broca.

Nota 1) Las condiciones de corte anteriores son para procesos con uso de refrigerante interno.

Nota 2) Compruebe el estado de las virutas y realice el mecanizado por pasos si es necesario. \* Referencia de la longitud del paso: de 0,2 a 1,0 DC

Nota 3) Ajuste las condiciones de corte en función de la máquina-herramienta, así como la rigidez de sujeción de la pieza de trabajo, la geometría de mecanizado, etc

Nota 4) No se recomienda mecanizar a profundidades que excedan la longitud de la hélice (LU).

Nota 5) Asegúrese de que el salto radial de la broca no supere los 0.03 mm.

Nota 6) No sujete la parte de la hélice de la broca.

## GUIA OPERACIONAL

### INSTRUCCIONES OPERATIVAS PARA LA DVAS L/D=2-40

## TALADRADO DE CARA PLANA ● Taladrado de agujero guía

### 1. Taladrado de agujero guía.

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el tipo superlong. Utilice la broca más corta posible. Una broca DVAS con L/D = 2 puede taladrar hasta L/D = 3 al hacer agujeros piloto.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad de taladrado: Aproximadamente DCx3 (Ajuste la profundidad del agujero guía según la longitud de la broca).

### 2. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones (Revoluciones a 500 – 1000 min.<sup>-1</sup>, velocidad de avance 1000 – 2000 mm/min.)
- ② Detenga la broca larga a 0.5 – 1 mm del fondo del agujero guía

### 3. Taladrado del agujero profundo.

- ① Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

### 4. Retracción de la broca

- ① Una vez taladrado, reduzca las revoluciones aprox. a 0.5 – 1 mm del final del agujero (Revoluciones en torno a 500 – 1000 min.<sup>-1</sup>)
- ② A continuación, retraiga la broca a una velocidad de avance de 1000 a 2000 mm/min.

## TALADRADO INTERRUPTIDO ● Taladrado e inserción en caras o ángulos irregulares.

### 1. Refrentado puntual

- ① Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

### 2. Taladrado de agujero guía

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el tipo superlong. Utilice la broca más corta posible.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad de taladrado: Aproximadamente DCx2 (Ajuste la profundidad del agujero guía según la longitud de la broca).

### 3. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones (Revoluciones a 500 – 1000 min.<sup>-1</sup>, velocidad de avance 1000 – 2000 mm/min.)
- ② Detenga la broca larga a 0.5 – 1 mm del fondo del agujero guía

### 4. Taladre el agujero profundo

- ① Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

### 5. Inserción

- ① Durante la inserción, el filo de corte puede resultar dañado
- ② Disminuya la velocidad de avance durante la inserción de la broca.

### 6. Retracción de la broca

- ① Después del taladrado, cambie las revoluciones a 500 – 1000 min.<sup>-1</sup>.
- ② A continuación, retraiga la broca a una velocidad de avance de 1000 – 2000 mm/min.

TALADRADO

## ■ INSTRUCCIONES OPERATIVAS PARA LA DVAS L/D=50

### TALADRADO DE CARA PLANA ● Taladrado de agujero guía

#### ■ 1. Taladrado de agujero guía.

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el tipo superlong.  
Use una broca DVAS con L/D = 7.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad de taladrado: Aproximadamente DCx7  
(Ajuste la profundidad del agujero guía según la longitud de la broca).

#### ■ 2. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones  
(Revoluciones a 500 – 1000 min.<sup>-1</sup>, velocidad de avance 1000 – 2000 mm/min.)
- ② Detenga la broca larga a 0.5 – 1 mm del fondo del agujero guía

#### ■ 3. Taladrado del agujero profundo.

- ① Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

#### ■ 4. Retracción de la broca

- ① Una vez taladrado, reduzca las revoluciones arox. a 0.5 – 1 mm del fondo del agujero (Revoluciones en torno a 500 – 1000 min.<sup>-1</sup>)
- ② A continuación, retraiga la broca a una velocidad de avance de 1000 a 2000 mm/min.

### TALADRADO INTERRUPTIDO ● Taladrado e inserción en caras o ángulos irregulares.

#### ■ 1. Refrentado puntual

- ① Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer refrentado puntual. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

#### ■ 2. Taladrado de agujero guía

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el tipo superlong. Use una broca DVAS con L/D = 7.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad de taladrado: Aproximadamente DCx7  
(Ajuste la profundidad del agujero guía según la longitud de la broca).

#### ■ 3. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones  
(Revoluciones a 500 – 1000 min.<sup>-1</sup>, velocidad de avance 1000 – 2000 mm/min.)
- ② Detenga la broca en el agujero guía a 0.5 – 1 mm del fondo del agujero.

#### ■ 4. Taladre el agujero profundo

- ① Comience a cortar a la velocidad y avance recomendados con un ciclo ininterrumpido (avance continuo).

#### ■ 5. Inserción

- ① Durante la inserción, el filo de corte puede resultar dañado
- ② Disminuya la velocidad de avance durante la inserción de la broca.

#### ■ 6. Retracción de la broca

- ① Después del taladrado, cambie las revoluciones a 500 – 1000 min.<sup>-1</sup>.
- ② A continuación, retraiga la broca a una velocidad de avance de 1000 – 2000 mm/min.

CARBURO  
(METAL DURO)

M  
TALADRADO

## ■ GUIA OPERACIONAL

### Amarre de la broca

La presión del tipo de tornillo amarra la broca con seguridad.

### Longitud de la broca

$$A \geq DC \times 2$$

### Instalación de la broca

No sujetar en las hélices.

### Refrigeración a presión

Ajuste la presión del refrigerante según el tipo y la concentración del mismo.

Diámetro Broca DC	Hidrosoluble	No hidrosoluble
DC < 2mm	≥ 3MPa	≥ 7MPa
DC < 3mm	≥ 2MPa	≥ 5MPa

### Taladrado guía

Para el taladrado de agujeros profundos, consulte la siguiente ilustración

$$L/D \leq 40$$

Use la DVAS X02S040

\*L/D = 2 puede taladrar hasta DCx3 al realizar agujeros piloto.

$$L/D > 40$$

Use la DVAS X07S040

### Utilización del refrigerante

En brocas de pequeño diámetro el agujero de refrigeración puede bloquearse debido a pequeñas partículas de suciedad y de virutas. Utilice siempre un filtro de malla fina como medida preventiva.

Diámetro Broca DC	Filtro de malla fina
DC < 2mm	≤ 10µm
DC < 3mm	≤ 20µm

### Pieza delgada

Sujetar la pieza  
**OK**

Si se produce un doblamiento

### Corte interrumpido

Proceso  
**OK**

① Bajar el avance cuando taladramos partes en corte interrumpido.

Se requiere mecanizar previamente  
① Refrentar con fresa integral antes de taladrar.

### Agujero previo

① Se divide en dos procesos.  
② Primero taladrar el agujero grande.  
\*Una herramienta para ambos mecanizados, chaflanar y refrentar se puede pedir para producir.

### Rebabas y astillado en el material

① Bajar el avance a un 50% al final del mecanizado.  
② Cambiar el punto del ángulo.

## Consejos para taladrar un agujero profundo que supere $L/D = 40$

Procedimiento para procesos con rotación de la pieza: tornos pequeños, automáticos, etc.

(1) Avellanado frontal (se recomienda la broca DLE)

(2) Taladre el agujero piloto a una profundidad de aproximadamente  $3 \times D$  (se recomienda la broca DVAS)

(3) Taladre el agujero profundo con la DVAS  X50S040.

Procedimiento para procesos con rotación de la herramienta: Centros de mecanizado, máquinas para materiales compuestos, etc.

(1) Taladre el agujero piloto a una profundidad de aproximadamente  $3 \times D$  (se recomienda la broca DVAS)

(2) Taladre el agujero piloto más profundo hasta una profundidad aproximada de  $7 \times D$   
Si se requiere estabilidad adicional, realice un agujero piloto más profundo que  $7 \times D$ .

(3) Taladre el agujero profundo con la DVAS  X50S040.

# TALADRADO (METAL DURO INTEGRAL)

## MINI-MVS

- Filo de corte recto que combina una mejora en la evacuación de las virutas y en la resistencia del propio filo de corte.
- El margen simple permite alcanzar un equilibrio óptimo y una gran precisión en el taladrado de diámetros pequeños.

#### TALADRADO DE CARA PLANA ● Taladrado de agujero ciego

##### ■ 1. Taladrado de agujero guía.

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utiliza si es posible la hélice más corta.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad del taladrado: Aprox. 1DC o mayor.  
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

##### ■ 2. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones.  
(Revoluciones a  $1000\text{min}^{-1}$ , vel. avance:  $0.2\text{mm}-0.3\text{mm/rev}$ )
- ② Detenga la broca larga a  $0.5-1\text{mm}$  del fondo inferior del agujero guía.

##### ■ 3. Taladrado del agujero profundo.

- ① Comience a la velocidad y avance recomendados con un ciclo de avance continuo (sin interrumpir).

##### ■ 4. Retracción de la broca

- ① Una vez taladrado, reduzca las revoluciones de corte aprox. a  $0.5-1\text{mm}$  del extremo final del agujero. (Revoluciones en torno a  $1000\text{min}^{-1}$ )
- ② Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3,000\text{mm/min}$ .
- ③ Finalmente acabe el agujero con una velocidad de corte de  $20-30\text{m/min}$ . y una velocidad de avance de  $0.2-0.3\text{mm/rev}$ .

#### TALADRADO INTERRUPTIDO ● Taladrado pasante y taladrado en caras o ángulos irregulares.

##### ■ 1. Planeado de caras o ángulos irregulares

- ① Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer planeados de caras y de ángulos irregulares. El diámetro del punto debe tener el mismo tamaño que el agujero que vamos a taladrar.

##### ■ 2. Taladrado de agujero guía

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utilice la broca más corta posible.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad del taladrado: Aprox. 1DC o mayor.  
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

##### ■ 3. Corte inicial con la broca larga

- ① Efectúe el agujero guía a bajas revoluciones. (Revoluciones a  $1000\text{min}^{-1}$  vel. avance:  $0.2\text{mm}-0.3\text{mm/rev}$ )
- ② Detenga la broca larga a  $0.5-1\text{mm}$  del extremo inferior del agujero guía.

##### ■ 4. Taladrado del agujero profundo

- ① Comience a taladrar a la velocidad y avance recomendados con un ciclo de avance continuo (sin interrumpir).

##### ■ 5. Taladrado pasante

- ① Durante la inserción, el filo de corte puede resultar dañado
- ② Disminuya la velocidad de avance durante la inserción de la broca.

##### ■ 6. Retracción de la broca

- ① Finalmente acabe el agujero con una velocidad de corte de  $20-30\text{m/min}$ . y una velocidad de avance de  $0.2-0.3\text{mm/rev}$ .
- ② Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3,000\text{mm/min}$ .

# MINI-MWS

- Micro brocas con refrigeración interna para un taladrado estable de agujeros profundos.
- Para un taladrado eficiente y de alta precisión de aceros al carbono y de materiales difíciles de mecanizar.

Dependiendo de las condiciones de corte, se recomienda el avance intermitente o interrumpido.</p>
<p><b>Tipos de refrigeración</b></p>  <p>Presión de refrigeración recomendada: <math>\geq 30</math> bar Presión mínima requerida 15 bar.</p>	<p><b>Pieza delgada</b></p>  <p>Suplementar con apoyos la pieza <b>OK</b></p> <p>Si se producen doblamientos <b>X</b></p>	<p><b>Utilización del refrigerante</b></p> <ol style="list-style-type: none"> <li>1) En brocas de pequeño diámetro el agujero de refrigeración puede bloquearse debido a pequeñas partículas de suciedad y de virutas.</li> <li>2) La suciedad y las pequeñas partículas se adhieren al refrigerante con el tiempo, dificultando el flujo eficiente del mismo. Se recomienda un cambio de refrigerante regular.</li> </ol>	

### ■ NOTAS DE UTILIZACIÓN

- Por favor utilizar un filtro de malla fina para el refrigerante para prevenir que se bloquee el agujero de aceite refrigerante.

# MPS1

- Nuevo recubrimiento de PVD basado en AlTiCrN.
- El doble margen de la MPS1 aporta precisión y fiabilidad de taladrado.

## Broca super long de doble margen

Refrigeración interna

### ● Tipo 1 Tipo mango cilíndrico con cuello cónico

MPS1----S/L-DIN-C/L8C-L40C

### ● Tipo 3 Mango tipo Whistle notch con cuello cónico

MPS1----S/L-DIN (Whistle notch)

### CÓMO UTILIZAR BROCAS SUPER LONG

#### TALADRADO DE CARA PLANA ● Taladrado de agujero ciego

##### 1. Taladrado de agujero guía.

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utilice la broca más corta posible.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad del taladrado: Aprox. 1DC o mayor.  
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

##### 2. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones.  
(Revoluciones a  $1000\text{min}^{-1}$ , vel. avance:  $0.2\text{mm}-0.3\text{mm/rev}$ )
- ② Detenga la broca larga a  $0.5-1\text{mm}$  del fondo inferior del agujero guía.

##### 3. Taladrado del agujero profundo.

- ① Comience a taladrar a la velocidad y avance recomendados con un ciclo de avance continuo (sin interrumpir).

##### 4. Retracción de la broca

- ① Una vez taladrado, reduzca las revoluciones de corte aprox. a  $0.5-1\text{mm}$  del extremo final del agujero. (Revoluciones en torno a  $1000\text{min}^{-1}$ )
- ② Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3,000\text{mm/min}$ .
- ③ Finalmente acabe el agujero con una velocidad de corte de  $20-30\text{m/min}$ . y una velocidad de avance de  $0.2-0.3\text{mm/rev}$ .

#### TALADRADO INTERRUPTIDO ● Taladrado pasante y taladrado en caras o ángulos irregulares.

##### 1. Refrentado puntual

- ① Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer planeados de caras y de ángulos irregulares. El diámetro del plano debe tener el mismo tamaño que el agujero que vamos a taladrar.

##### 2. Taladrado de agujero guía

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utilice la broca más corta posible.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad del taladrado: Aprox. 1DC o mayor.  
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

##### 3. Corte inicial con la broca larga

- ① Efectúe el agujero guía a bajas revoluciones. (Revoluciones a  $1000\text{min}^{-1}$  vel. avance:  $0.2\text{mm}-0.3\text{mm/rev}$ )
- ② Detenga la broca larga a  $0.5-1\text{mm}$  del extremo inferior del agujero guía.

##### 4. Taladrado del agujero profundo

- ① Comience a taladrar a la velocidad y avance recomendados con un ciclo de avance continuo (sin interrumpir).

##### 5. Inserción

- ① Durante la salida del agujero pasante, el filo de corte puede resultar dañado.
- ② Disminuya la velocidad de avance durante la salida del agujero pasante.

##### 6. Retracción de la broca

- ① Finalmente taladre el agujero con una velocidad de corte de  $20-30\text{m/min}$ . y una velocidad de avance de  $0.2-0.3\text{mm/rev}$ .
- ② Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3,000\text{mm/min}$ .

# MICRO-MGS

- Permite taladrados de micro agujeros profundos.
- Un mínimo salto radial asegura un taladrado de máxima precisión.

Nota 1) Para mayor seguridad y mejores resultados, utilice refrigerante a alta presión. (Presión mínima del refrigerante=1000 PSI)

Nota 2) El filtro del refrigerante debe ser de menos de 5 micras.

Es preciso hacer un filtrado fino para evitar que se obstruyan los agujeros del refrigerante.

Nota 3) Se requiere un agujero piloto o un casquillo guía.

Nota 1) Para mayor seguridad y mejores resultados, utilice refrigerante a alta presión. (Presión mínima del refrigerante=70 bar)

Nota 2) El filtro del refrigerante debe ser de menos de 5 micras.

Es preciso hacer un filtrado fino para evitar que se obstruyan los agujeros del refrigerante.

Nota 3) Se requiere un agujero piloto o un casquillo guía.

## CÓMO SE UTILIZA

1. Taladrado de agujeros guía.  
(Se recomiendan brocas MWE o MWS de Mitsubishi Materials.)

2. Introduzca la broca en el agujero guía sin rotarla o con una rotación inversa por debajo de 300 rpm.

3. Activar el refrigerante, aumentar el avance y la velocidad de corte a las condiciones recomendadas, y comenzar el proceso de taladrado.

4. Tras taladrar volver al "paso 2", desactivar el refrigerante y detener la rotación de la broca.

# TALADRADO (METAL DURO INTEGRAL)

# MMS

- Para un taladrado eficiente y de alta precisión de aceros inoxidables.
- Los agujeros de refrigeración triangulares empiezan desde diámetro de 4.60 mm.

Nota 1) Es recomendable el uso de refrigeración interna a alta presión.

Nota 2) Se recomienda un refrigerante de emulsión con base acuosa.

Nota 3) Cuando se utilice refrigerante sin agua, reducir las revoluciones un 10 – 20 %.

## LISTA DE REFERENCIAS CRUZADAS DEL ACERO INOXIDABLE

Material		Alemania		E.E.U.U.	Japón
		W-no.	DIN	AISI/SAE	JIS

Nota 1) Para que el taladrado sea estable se recomienda una alta presión de refrigerante a través del husillo.

Nota 2) Se recomienda la refrigeración por emulsión del tipo hidrosoluble.

Nota 3) Al usar refrigerante del tipo no hidrosoluble reduzca la velocidad de corte en un 10-20 %.

Nota 4) Cuando se taladra con un sistema de refrigeración externo, se recomienda el taladrado de avance por pasos en cada profundidad DC x 0,5 para permitir la rotura de las virutas.

## ■ GUIA OPERACIONAL DE LA BROCA LARGA DE TIPO MNS (L/D 10, 12, 15, 20, 25, 30)

### TALADRADO DE CARA PLANA ● Taladrado de un agujero ciego

#### ■ 1. Taladrado de un agujero previo.

- ① Para los agujeros guía, recomendamos utilizar brocas Mitsubishi Materials tipo MNS, MAE-MB o MAS-MB.
- ② Utilizar una broca con el mismo diámetro que la de taladrado profundo.
- ③ Profundidad del agujero guía: mín. 1DC o más profundo.  
(Ajuste la profundidad del agujero guía en función de la longitud del tipo largo.)

#### ■ 2. El corte inicial con la broca de tipo largo

- ① Entrada en el agujero guía a bajas revoluciones.  
(Velocidad de corte 20–30m/min, avance 0.2–0.3mm/rev).
- ② Detener la broca para agujeros profundos 1–3mm desde la parte de abajo del agujero guía.

#### ■ 3. Taladrado del agujero profundo

- ① Aumente la velocidad de giro y el avance a un ciclo y taladre hasta la profundidad de taladrado deseada.

#### ■ 4. Retracción de la broca

- ① Después del taladrado, reduzca las revoluciones de corte cuando se encuentre aproximadamente a 1–2mm del final del agujero. (Velocidad de corte de aproximadamente 20–30m/min)
- ② Retire la broca hasta el punto inicial de la profundidad del agujero guía con un avance de 3000 mm/min.
- ③ Por último, retírese del agujero con una velocidad de corte de 20–30m/min y un avance de 0.2–0.3mm/rev.

### TALADRADO INTERRUPTIDO ● Taladrado pasante y taladrado en caras o ángulos irregulares.

#### ■ 1. Refrentado

- ① Al mecanizar un agujero profundo sobre una superficie inclinada, utilice la broca MFE para un agujero guía.
- ② Asegurarse de que se realiza un agujero de alta precisión para la guía.
- ③ Profundidad de taladrado: Aprox. DC×1.

#### ■ 2. Taladrado de un agujero previo.

- ① Para los agujeros guía, recomendamos utilizar brocas Mitsubishi Materials tipo MNS, MAE-MB o MAS-MB.
- ② Utilizar una broca con el mismo diámetro que la de taladrado profundo.
- ③ Profundidad del agujero guía: mín. 1DC o más profundo.  
(Ajuste la profundidad del agujero guía en función de la longitud del tipo largo.)

#### ■ 3. El corte inicial con la broca de tipo largo

- ① Entrada en el agujero guía a bajas revoluciones. (Velocidad de corte 20–30 m/min, avance 0.2–0.3mm/rev).
- ② Detener la broca para agujeros profundos 1–3 mm desde la parte de abajo del agujero guía.

#### ■ 4. Taladrado del agujero profundo

- ① Aumente la velocidad de giro y el avance a un ciclo y taladre hasta la profundidad de taladrado deseada.

#### ■ 5. Inserción

- ① Durante la salida del agujero pasante, el filo de corte puede resultar dañado.
- ② Se recomienda un avance de 0.05mm–0.1mm/rev.

#### ■ 6. Retracción de la broca

- ① Retire la broca hasta el punto inicial de la profundidad del agujero guía con un avance de 3000mm/min.
- ② Por último, despeje el agujero con una velocidad de corte de 20–30m/min y un avance de 0.2–0.3mm/rev.

Nota 1) Si se utiliza la broca con una longitud superior a L/D 10, es necesario utilizar "agujeros previos" como guía.  
(Si no se utiliza un agujero-previo, puede romperse la broca.)  
Nota 2) Utilizar la broca con la hélice más corta en los respectivos diámetros para realizar el agujero guía.

## ■ GUIA OPERACIONAL

<p><b>Amarre de la broca</b></p>  <p>Las pinzas de sujeción amarran la broca con seguridad.</p>	<p><b>Longitud de la broca</b></p>  <p><math>A \geq DC \times 2</math></p>	<p><b>Instalación de la broca</b></p>  <p>No sujetar en las hélices.</p>	<p><b>Tipos de refrigeración</b></p>  <p>La presión del refrigerante es aproximadamente 15 bar – 70 bar. Presión de refrigeración recomendada: <math>\geq 30</math> bar</p>
<p><b>Instalación de la broca</b></p>  <ol style="list-style-type: none"> <li>1) Realice un agujero guía de, aproximadamente, 1DC (DC: diámetro de la broca) utilizando la MHS con las hélices más cortas.</li> <li>2) Utilizar el agujero guía para taladrar el agujero objetivo, utilizar una broca con refrigeración interna. Dependiendo de la aplicación, hacer el ciclo de taladrado discontinuo.</li> </ol>	<p><b>Utilización del refrigerante</b></p> <ol style="list-style-type: none"> <li>1) El polvo y las partículas de aceite que hay en el refrigerante viejo pueden obstruir el agujero e impedir el flujo. Es recomendable cambiar regularmente el refrigerante.</li> <li>2) Las pequeñas partículas de viruta metálica atascarán el agujero para el aceite. Utilice un filtro como medida preventiva. Si utiliza brocas de pequeño diámetro, utilice un filtro de retícula fina.</li> </ol>	<p><b>Pieza delgada</b></p>  <p>Suplementar con apoyos la pieza</p> <p>Si se producen doblamientos</p>	<p><b>Corte interrumpido</b></p>  <p>Proceso OK</p> <p>Ⓛ Bajar el avance cuando taladramos la parte de corte interrumpido.</p> <p>Se requiere mecanizar previamente</p> <p>Ⓛ Realizar una cara plana previa al taladrado.</p>

## ■ INSTRUCCIONES OPERATIVAS PARA LA BROCA LARGA MHS (L/D ≥ 10)

### TALADRADO DE CARA PLANA ● Taladrado de agujero ciego

#### ■ 1. Taladrado de agujero guía.

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utilice la broca más corta posible.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad del taladrado: Aprox. 1DC o mayor.  
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

#### ■ 2. Corte inicial con la broca larga

- ① Realice el agujero guía a bajas revoluciones.  
(Revoluciones a  $1000\text{min}^{-1}$ , vel. avance:  $0.2\text{mm}-0.3\text{mm/rev}$ )
- ② Detenga la broca larga a  $0.5-1\text{mm}$  del extremo inferior del agujero guía.

#### ■ 3. Taladrado del agujero profundo.

- ① Comience a cortar a la velocidad y avance recomendados con un ciclo de avance continuo (sin interrumpir).

#### ■ 4. Retracción de la broca

- ① Una vez taladrado, reduzca las revoluciones de corte aprox. a  $0.5-1\text{mm}$  del extremo final del agujero. (Revoluciones en torno a  $1000\text{min}^{-1}$ )
- ② Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3,000\text{mm/min}$ .
- ③ Finalmente acabe el agujero con una velocidad de corte de  $20-30\text{m/min}$ . y una velocidad de avance de  $0.2-0.3\text{mm/rev}$ .

### TALADRADO INTERRUPTIDO ● Taladrado pasante y taladrado en caras o ángulos irregulares.

#### ■ 1. Refrentado puntual

- ① Mecanice un plano en la cara irregular utilizando una broca o fresa para ranurado capaz de hacer planeados de caras y de ángulos irregulares. El diámetro del punto debe tener el mismo tamaño del agujero profundo requerido.

#### ■ 2. Taladrado de agujero guía

- ① Utilice una broca con un ángulo de punta mayor (más plano) que el súper-largo. Utilice la broca más corta posible.
- ② Asegúrese de taladrar un agujero de alta precisión como guía.
- ③ Profundidad del taladrado: Aprox. 1DC o mayor.  
(Ajuste la profundidad del agujero guía según la longitud del modelo súper-largo).

#### ■ 3. Corte inicial con la broca larga

- ① Efectúe el agujero guía a bajas revoluciones.  
(Revoluciones a  $1000\text{min}^{-1}$  vel. avance:  $0.2\text{mm}-0.3\text{mm/rev}$ )
- ② Detenga la broca larga a  $0.5-1\text{mm}$  del extremo inferior del agujero guía.

#### ■ 4. Taladrado del agujero profundo

- ① Comience a cortar a la velocidad y avance recomendados con un ciclo sin perforación (avance continuo).

#### ■ 5. Inserción

- ① Durante la salida del agujero pasante, el filo de corte puede resultar dañado.
- ② Disminuya la velocidad de avance durante la salida del agujero pasante.

#### ■ 6. Retracción de la broca

- ① Finalmente taladre el agujero con una velocidad de corte de  $20-30\text{m/min}$ . y una velocidad de avance de  $0.2-0.3\text{mm/rev}$ .
- ② Retraiga la broca hasta el punto de salida, a la profundidad del agujero guía, con una velocidad de avance de  $3,000\text{mm/min}$ .

# TALADRADO (CON PLACAS INTERCAMBIABLES)

# STAW

- Diseño del filo de corte ondulado para un mejor control de las virutas.
- El sistema rígido de sujeción ofrece estabilidad y fiabilidad en el taladrado de agujeros pequeños.

## ANCHO DE HONING

Si se necesita una placa con honing diferente al estándar, por favor utilice la nomenclatura a continuación:

(Referencia placa)

Tipo Honing	Ancho de corte (mm)
F	0
G	0.02–0.05
H	0.05–0.10
- (Estándar)	0.10–0.15
K	0.15–0.20
S	0.20–0.25
M	0.25–0.30

## CONDICIONES DE CORTE RECOMENDADAS

Material	Diámetro Broca	Ø 10.0–Ø 12.9		Ø 13.0–Ø 13.9		Ø 14.0–Ø 15.4		Ø 15.5–Ø 18.4	
		Condiciones	Velocidad de corte (m/min)	Avance (mm/rev.)	Velocidad de corte (m/min)	Avance (mm/rev.)	Velocidad de corte (m/min)	Avance (mm/rev.)	Velocidad de corte (m/min)
P Acero dulce Acero al carbono Acero aleado	≤180HB	80 (60–100)	0.20 (0.15–0.25)	90 (70–110)	0.25 (0.20–0.30)	100 (80–120)	0.30 (0.25–0.35)	100 (80–120)	0.35 (0.25–0.40)
	180–280HB	80 (60–100)	0.20 (0.15–0.25)	90 (70–110)	0.25 (0.20–0.30)	100 (80–120)	0.30 (0.25–0.35)	100 (80–120)	0.35 (0.25–0.40)
	280–350HB	70 (60–90)	0.20 (0.15–0.25)	80 (60–100)	0.25 (0.20–0.30)	90 (70–110)	0.25 (0.20–0.30)	90 (70–110)	0.30 (0.20–0.35)
M Acero inoxidable	≤200HB	40 (30–50)	0.13 (0.10–0.16)	50 (40–60)	0.15 (0.12–0.18)	60 (50–70)	0.17 (0.14–0.20)	60 (50–70)	0.17 (0.14–0.20)
K Fundición Fundición dúctil	Resistencia a la tracción ≤350MPa	80 (60–100)	0.20 (0.15–0.25)	90 (70–110)	0.25 (0.20–0.30)	100 (80–120)	0.30 (0.25–0.35)	120 (80–140)	0.45 (0.35–0.55)
	Resistencia a la tracción ≤450MPa	70 (60–90)	0.20 (0.15–0.25)	80 (60–100)	0.25 (0.20–0.30)	90 (70–110)	0.30 (0.25–0.35)	100 (80–120)	0.35 (0.25–0.40)

Nota 1) Al usar una broca para una profundidad de agujero de Dcx1.5, es posible aumentar el avance en aprox. un 20 %.

Nota 2) Al usar la broca de longitud DC x 8, reducir la velocidad de corte en un 20 %.

Nota 3) Al usar la broca de longitud DC x 8, se recomienda realizar un agujero guía piloto.

Nota 4) Para el acero inoxidable, utilice refrigeración interna, (No se recomienda la refrigeración por pulverización ni MQL).

## NOTAS DE UTILIZACIÓN

### ■ INSTALACIÓN DE LA PLACA

1. Antes de introducir la placa compruebe que no hay ningún objeto extraño ni restos de suciedad en la ranura o hendidura de la broca. Si es necesario, límpielo con aire comprimido.
2. Para aflojar el tornillo interno y abrir la punta de la broca, utilice la llave que se incluye. A continuación coloque la placa en la ranura como indica la figura 1.  
\*Cuando apriete, compruebe que la llave mantiene firmemente el contacto con la base de la cabeza del tornillo interno.
3. Una vez fijada la placa dentro de la ranura de la broca, apriete el tornillo interno empujando al mismo tiempo con suavidad la placa hacia dentro de la ranura, tal como indica la figura 2, para que quede bien sujeta y centrada.  
\*Cuando apriete, compruebe que la llave mantiene firmemente el contacto con la base de la cabeza del tornillo interno.

Fig. 1

Fig. 2

Apriete el tornillo de fijación según el par que se indica a continuación.

Diám. Broca (mm)	Torsión
	N•m
10 – 12.9	1
13 – 15.4	2
15.5 – 18.4	2.5

4. Asegúrese de que no queda ningún espacio hueco entre la base de la placa y la ranura del mango.

Nota 1) Si las placas están mal o incorrectamente sujetas, puede reducirse su rendimiento en el taladrado e incluso llegar a romperse la broca. Asegúrese, por tanto, de que coincidan las marcas de alineación que hay tanto en el cuerpo como en la placa. A la hora de mecanizar, utilice protecciones y gafas de seguridad.

TALADRADO

# Notas

---

A series of horizontal dashed lines for writing notes.

# TALADRADO (CON PLACAS INTERCAMBIABLES)

CARBURO  
(METAL DURO)

# TAW

- Diseño del filo de corte ondulado para un mejor control de las virutas.
- Geometría dentada para mayor precisión de posicionamiento de la placa.
- Cambio de placa sencillo.

Nota 1) Se recomienda el honing tipo H para el mecanizado de aceros dulces e inoxidables.

Nota 2) Solo recomendado para el uso de una máquina de gran rigidez. Utilizar el sistema de refrigeración interna cuando mecanizamos el acero inoxidable. No se recomienda el uso de refrigeración tipo MQL ni por pulverización.

# TAW

## ANCHO DE HONING

Si se necesita una placa con honing diferente al estandar, por favor ver simbolos de abajo.

(Referencia placa)

Tipo Honing	Ancho de corte (mm)
F	0
G	0.02–0.05
H	0.05–0.10
- (Estándar)	0.10–0.15
S	0.20–0.25
M	0.25–0.30

## NOTAS DE UTILIZACIÓN

### INSTALACIÓN DE LA PLACA

- Quite el tornillo para instalar la placa. (Placa tipo H)
- Coger la placa con la parte dentada hacia abajo y deslizarla en la ranura del cuerpo de la broca.
- Amarrar la placa apretando el tornillo con la llave suministrada, sujetar la placa ligeramente durante la operación como se muestra. (Figura 1)
- Comprobar que entre a la placa y la base de la ranura de la broca no hay ningún hueco. (Figure 2)

Apriete el tornillo de fijación según el par de torsión indicado a continuación.

Diám. Broca	Torsión
Ø14–Ø15	2.0N•m
Ø16–Ø18	2.0N•m
Ø19–Ø21	3.5N•m
Ø22–Ø24	5.5N•m
Ø25–Ø27	8.5N•m
Ø28–Ø30	12.0N•m

Fig. 1

OK

NO

→ Espacio hueco

Fig. 2

## CAMBIO DE LA PLACA

- Los dientes de la broca y de la placa deben estar limpios antes de instalar una nueva placa. Para eliminar la suciedad de la broca se puede usar la zona dentada de la galga suministrada.

# Notas

---

A series of horizontal dashed lines for writing notes, spanning the width of the page.

# TALADRADO (CON PLACAS INTERCAMBIABLES)

CARBURO  
(METAL DURO)

# MVX

- Combinación ideal de placa exterior de CVD y placa interior de PVD.
- Cuerpo de gran rigidez que permite el mecanizado de agujeros con una profundidad L/D=6.

# JUST FIT SLEEVE [JFS]

CARBURO  
(METAL DURO)

M  
TALADRADO

- Casquillo diseñado para conseguir mejores resultados con la broca MVX, permite incrementar el diámetro de la broca en intervalos 0.1mm.

Referencia conjunto	Referencia individual	Stock	Dimensiones (mm)							*Aumento (S11×2)	Broca MVX adecuada

No se corresponde con el diámetro del mango de 50 mm.

\*Aumento: Tamaño de aumento en el diámetro de corte.

## ■ GUIA PARA ELEGIR JUST FIT SLEEVE

Diámt. Deseado = Broca Ø + Incremento de JFS + 0.1mm

(Ej.) El diámetro deseado es 20.3mm tomamos +0.1 mm como tolerancia.

$$\text{Ø}20.3 = (\text{MVX2000 X ØF25} + \text{JFS3225-20}) + 0.1$$

↓  
Broca de 20mm

↓  
Utilizando un JFS con un incremento de 0.2 mm

↓  
Voladizo

<Herramienta seleccionada>  
Broca : MVX2000 X ØF25  
Just fit sleeve (JFS)  
: JFS3225-20

Nota 1) La tolerancia puede variar debido a las condiciones de corte utilizadas, por favor siga la tabla de arriba.

## ■ PEDIDOS DE JUST FIT SLEEVE

### ● Método de compra 1

La tolerancia puede variar en función de las condiciones de corte utilizadas. Por lo tanto, se recomienda comprar como un lote. Cuando haga un pedido, utilice las referencias indicadas. (5 fundas/lote)

### ● Método de compra 2

Es posible hacer pedidos unitarios. Cuando haga un pedido, utilice las referencias individuales.

● : Stock Europa. ★ : Stock Japón.

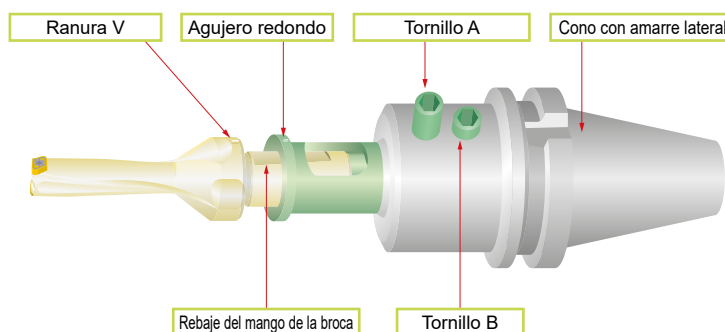

## NOTAS DE USO DE JUST FIT SLEEVE

1. Cuando coloque la herramienta en el cono de amarre, alinee la ranura V del filo periférico exterior de la broca, con los agujeros redondos del eje periférico exterior de la brida del casquillo y con los tornillos de fijación de la broca. (Si la broca no tiene ranura V, alinear el rebaje del mango de la broca con los agujeros redondos del casquillo.)

2. El tornillo A del lateral del cono de amarre aprieta la broca directamente a través del hueco del casquillo. Apretar el tornillo B hasta un punto en el que no se pueda dañar el casquillo.

(Nota)

- No se pueden realizar ajustes finos para el diámetro final con el casquillo.
- No puede utilizarse con herramientas con pinza de sujeción.

## NOTAS DE USO DE LA BROCA MVX

### Utilización en un torno

(1) La placa exterior y el eje X de la máquina deben situarse en paralelo. La broca está diseñada de modo que el centro de la placa interior quede 0-0,15 mm más baja al alinear el centro de la broca con el centro del eje de la máquina.

\*La placa interior puede romperse si la altura del centro de la placa interior es mayor al eje X de la máquina.

(2) Para ajustar el diámetro del agujero con el desplazamiento de la broca, el filo de corte y el eje de la máquina deben estar en paralelo. Consulte la lista de dimensiones del portaherramientas para conocer la tasa de ajuste máxima de cada portaherramientas.

\*No se recomienda ajustar en la dirección del eje X negativo (dirección de reducción del diámetro del agujero), ya que el portaherramientas podría interferir con el agujero.

(3) Al taladrar agujeros pasantes en un torno, el disco producido por la broca al salir de la pieza de trabajo puede salir despedido a alta velocidad. Para reducir el peligro de lesiones o daños, se recomienda utilizar las protecciones de la máquina.

Nota 1) Reduzca las revoluciones y el avance en función del taladrado cuando la sujeción del material no tenga la rigidez suficiente o su máquina tenga limitaciones.

Nota 2) Utilizar en un portabrocas o en un cono con pinza de apriete.

Nota 3) Utilice suficiente fluido de corte.

Nota 4) Cuando taladramos agujeros de mayor profundidad que 4 veces el diámetro de la broca, utilizar un proceso de taladrado interrumpido.

Nota 5) Las condiciones de corte mencionadas más arriba son las estándar cuando se utiliza refrigerante soluble en agua.  
Reduzca las revoluciones cuando corte con refrigerante no soluble en agua.

Nota 1) Reduzca las revoluciones y el avance en función del taladrado cuando la sujeción del material no tenga la rigidez suficiente o su máquina tenga limitaciones.

Nota 2) Utilizar en un portabrocas o en un cono con pinza de apriete.

Nota 3) Utilice suficiente refrigerante.

Nota 4) Cuando taladramos agujeros de mayor profundidad que 4 veces el diámetro de la broca, utilizar un proceso de taladrado interrumpido.

Nota 5) Las condiciones de corte mencionadas más arriba son las estándar cuando se utiliza refrigerante soluble en agua.

Reduzca las revoluciones cuando corte con refrigerante no soluble en agua.

Nota 1) Reduzca las revoluciones y el avance en función del taladrado cuando la sujeción del material no tenga la rigidez suficiente.

Nota 2) Las condiciones de corte mencionadas más arriba son las estándar cuando se utiliza refrigerante soluble en agua.

Reduzca las revoluciones cuando corte en fluido no soluble en agua.

30.0	370	0.37	270	0.37	190	0.34	160	0.18								
32.0	350	0.38	250	0.38	180	0.35	150	0.19								

Nota 1) Las anteriores condiciones de corte son para perforar a profundidades DCx3, sin agujero previo. Si hay que perforar agujeros de menos de DCx1, se pueden incrementar las RPM en un 20%.

Nota 2) Se recomienda taladrar sin agujero guía.

Si se realiza agujero guía, puede que la viruta no se rompa. Utilice un ciclo de avance interrumpido cuando necesite romper la viruta.

Nota 3) Para taladrado de superficies inclinadas es recomendable realizar un fresado previo con una fresa integral de metal duro.

Nota 4) Para mecanizar aceros inoxidables austeníticos (X5CrNi1810), reduzca las revoluciones en un 30 – 60% y reduzca la velocidad de avance en un 40 – 60%.

Nota 5) Utilice un portabrocas de amarre con pinza.

Nota 6) Reduzca las revoluciones y la velocidad de avance en función de la situación del taladrado, cuando la rigidez de la máquina o la sujeción de la pieza sean bajas.

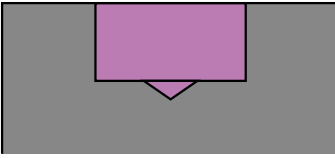

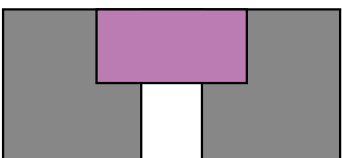

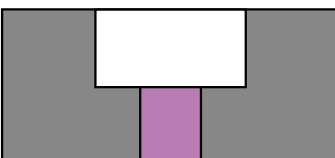

Nota 7) Utilice una cantidad suficiente de fluido de corte.

Nota 8) Las anteriores condiciones le servirán de guía a la hora de utilizar fluido de corte hidrosoluble.

Si emplea fluido no soluble en agua, reduzca las revoluciones.

## MÉTODO DE CORTE RECOMENDADO

■ La VAPDSCB consigue un mecanizado altamente eficiente sin que se atasque la viruta.

Método general de corte		Método de corte de la VAPDSCB	
<p>① Taladrado de agujeros para pernos</p> 	<p>Geometría viruta</p>  <p>Bueno</p>	<p>① Avellanado plano</p> 	<p>Geometría viruta</p>  <p>Bueno</p>
<p>② Avellanado plano</p> 	<p>Viruta enmarañada</p> 	<p>② Taladrado de agujeros de perno</p> 	<p>Bueno</p> 

Nota 1) Si taladra con la VAPDSCB, es posible que, al realizar un agujero previo se genere viruta continua que puede llegar a enrollarse alrededor de la herramienta.

CARBURO  
(METAL DURO)

ESCARIADOR DE CABEZA INTERCAMBIABLE

# RX1S

Cabezal de cambio rápido con gran precisión de salto radial

Diseño óptimo del cabezal para adaptarse al flujo de refrigerante

TALADRADO

Geometría helicoidal para aplicaciones con agujeros pasantes en componentes

Agujeros de refrigeración en el canal de la hélice

Geometría de ranura recta para agujeros ciegos de componentes

Agujero de refrigeración central

## Fácil de usar con tolerancia de agujeros de precisión

Tolerancia del agujero de la pieza H7

Tolerancia D1 H7

### Mecanismo de montaje de alta precisión

La doble sujeción mediante superficie cónica y bloqueo central consigue una alta precisión de salto radial.

### Cabezal de metal duro

Altas velocidades de corte permiten un elevado rendimiento.

### Filo de corte pulido y rectificadado

Excelente acabado de las superficies que favorece una buena evacuación de la viruta.

## Disponibilidad de soporte corto y largo

X03

X05

## Para una amplia gama de materiales

---

La combinación de un sustrato de metal duro muy versátil con un recubrimiento de PVD ha logrado un escariado de alta precisión con una larga vida útil de la herramienta.

Acero

Acero  
Inoxidable

Fundición

Aleaciones  
termorresistentes

## Opciones personalizadas

---

Se pueden fabricar cabezales de escariado a medida, con un diseño óptimo y diferentes clases de tolerancia de agujeros, en incrementos de 1  $\mu\text{m}$ , en diámetros (DC) de 14 mm a 29 mm.

# ESCARIADOR DE CABEZA INTERCAMBIABLE

# RX1S

**NEW**

 CARBURO  
(METAL DURO)

 M  
TALADRADO

## CONDICIONES DE CORTE RECOMENDADAS

	Material	Propiedades	Velocidad de corte (m/min)	Avance (mm/diente)	
				DC<20	DC≥20
<b>P</b>	Acero dulce (S144-2, C10 etc.)	Dureza ≤180HB	120 (90–155)	0.10–0.20	0.10–0.22
	Acero al carbono, Acero aleado (S45C, SCM440 etc.)	Dureza 180–280HB	120 (90–155)	0.10–0.20	0.10–0.22
	Acero al carbono, Acero aleado (40CrNiMoA etc.)	Dureza 280–350HB	100 (75–130)	0.10–0.20	0.10–0.22
<b>M</b>	Acero Inoxidable Austenítico (SUS304, SUS316 etc.)	Dureza ≤200HB	20 (15–30)	0.08–0.15	0.08–0.18
	Acero inoxidable ferrítico (772.855 etc.)	—	40 (30–60)	0.08–0.18	0.08–0.20
	Acero dúplex (SUS329J1 etc.)	—	20 (15–30)	0.08–0.15	0.08–0.18
	Aceros inoxidables endurecidos (17-4PH etc.)	—	40 (30–60)	0.08–0.18	0.08–0.20
<b>K</b>	Fundición gris (GG-30 etc.)	Resistencia a la tracción ≤350MPa	110 (80–130)	0.10–0.20	0.10–0.22
	Fundición dúctil (GJS-450-10 etc.)	Resistencia a la tracción ≤450MPa	90 (65–110)	0.10–0.20	0.10–0.22
<b>S</b>	Aleación termorresistente (Inconel®718 etc.)	—	30 (20–40)	0.08–0.18	0.10–0.20
	Aleación de titanio (Ti-6Al-4V etc.)	—	30 (20–40)	0.08–0.18	0.10–0.20

## TOLERANCIA DE MECANIZADO DE ACABADO POR DIÁMETRO (mm)

DC	14≤DC<15	15≤DC<20	20≤DC≤29
Tolerancia de mecanizado	0.15–0.30	0.15–0.35	0.20–0.40

# ¿CÓMO SE INSTALA EL CABEZAL?

# 1

Utilizar una llave Torx para ajustar la cantidad de saliente de acuerdo con la dimensión L que se indica a continuación.  
Los filos de corte son afilados, por lo que deben utilizarse guantes de protección.

# 2

Introducir la cabeza en el soporte.  
En este momento, se observará una ligera separación entre la cara final del soporte y el cabezal.

# 3

Utilizar una llave Torx para apretar hasta que el soporte y el cabezal queden firmemente sujetos.

Tipo Herramienta	Tornillo	Llave de fijaicón	Torsión (N•m)
RX1SX S16ATP1	RX1ST8TP1	T8	2
RX1SX S20ATP2, TP3	RX1ST10TP23	T10	3
RX1SX S20ATP4, TP5	RX1ST15TP45	T15	5
RX1SX S25ATP6	RX1ST25TP6	T25	9

Nota 1) La caja de tornillos de repuesto incluye 5 unidades.

# GUIA OPERACIONAL

CARBURO  
(METAL DURO)

M

TALADRADO

- Usar un cabezal helicoidal para agujeros pasantes y un cabezal recto para agujeros ciegos. El helicoidal está diseñado para evacuar las virutas hacia delante y el recto está diseñado para evacuar las virutas hacia atrás.

Tipo helicoidal

Tipo recto

- Se recomienda biselar la entrada del agujero piloto antes de escariar.
- En procesos de escariado, se recomienda usar el mismo avance en el retroceso de la herramienta.
- Al colocar la herramienta en la máquina, la precisión de salto radial del filo de corte debe ser de 5  $\mu\text{m}$  o menos.
- Para el soporte, se recomienda un cono hidráulico.

- La primera recomendación para obtener los mejores resultados es utilizar refrigerante interno pasante y después refrigerante externo. No se recomienda el corte en seco. Para agujeros ciegos, con refrigerante externo, no se recomienda escariar más allá de la profundidad  $DC \times 3$ .

- Para el escariado con refrigerante de paso interno, la presión debe ser inferior a 8MPa.

● No se recomienda el escariado de los agujeros que se cruzan en diagonal.

● Por favor, bisele las superficies cilíndricas antes de escariar.

● Es posible escariar con placas apiladas y un centro cóncavo.

● No se recomienda escariar si la entrada/salida del agujero piloto está en una superficie inclinada.

# Notas

---

A series of horizontal dashed lines for writing notes, spanning the width of the page.

# DESGASTE DE LA BROCA Y DAÑOS DEL FILO DE CORTE

## ■CONDICION DE DESGASTE DE LA BROCA

La tabla de abajo muestra un dibujo sencillo que describe el desgaste del filo de corte de la broca. La generación y la cantidad de desgaste varían según los materiales de la pieza de trabajo y las condiciones de corte empleadas. Pero en general, el desgaste periférico es mayor y determina la vida útil de la herramienta. Al reafilar, el flanco se desgasta en el punto que tiene que ser rectificadopor completo. Por lo tanto, si hay un desgaste mayor hay que eliminar más material para renovar el filo de corte.

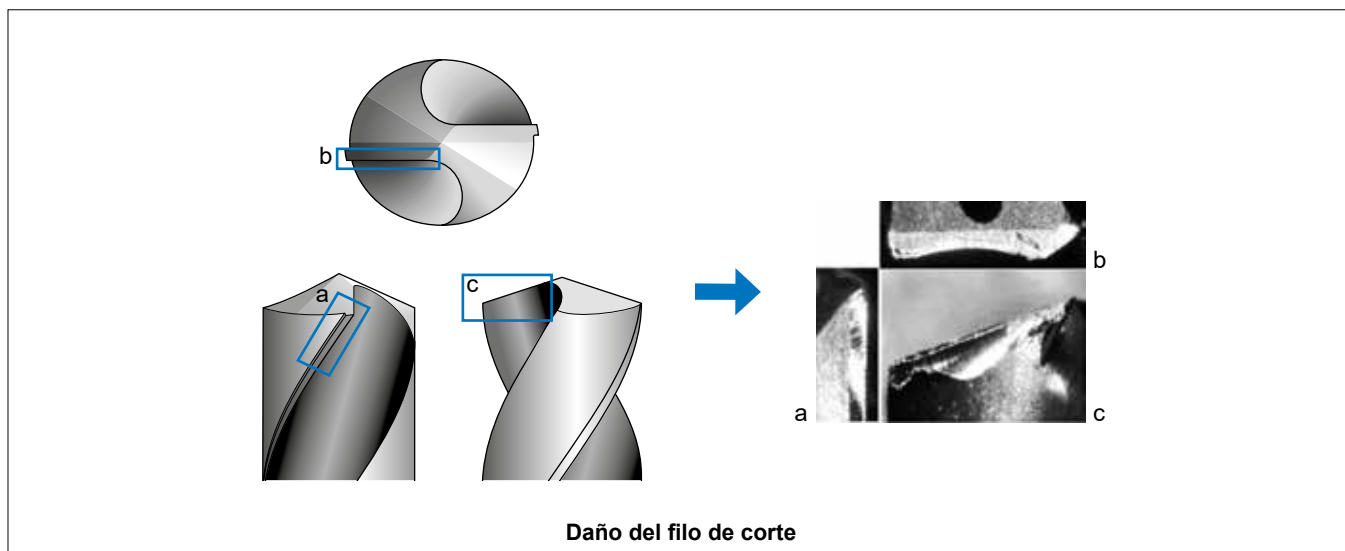

P

DATOS TÉCNICOS

## ■DAÑO DEL FILO DE CORTE

Al taladrar, el filo de corte de la broca puede sufrir, roturas y daños anormales. En estos casos, es importante mirar con detalle los daños, investigar la causa y tomar contramedidas.

# CARACTERÍSTICAS Y ESPECIFICACIONES DE LAS BROCAS

## ■ NOMENCLATURA

DATOS TÉCNICOS

## ■ ESPECIFICACIONES DE LA FIGURA Y CARACTERÍSTICAS DE CORTE

Ángulo de hélice	Es la inclinación de la hélice respecto a la dirección axial de una broca; lo que corresponde al ángulo de desprendimiento de una placa. El ángulo de desprendimiento de una broca, varía de acuerdo con la posición del filo de corte, y disminuye en cuanto la circunferencia se aproxima al centro. <b>Material de gran dureza Pequeña ◀••Ángulo de desprendimiento••▶ Grande Material blando (Aluminio, etc.)</b>			
Longitud de hélice	Está determinada por la profundidad del agujero, longitud del casquillo y límite del reafilado. Ya que tiene una gran influencia en la vida de la broca; es necesario minimizarla tanto como sea posible.			
Ángulo de la punta	El ángulo estándar es de 118° y puede variar en función de la aplicación de la broca. <b>Material blando, con buena maquinabilidad. Pequeña ◀••Ángulo de la punta••▶ Grande Para material duro y mecanizado de alta eficiencia</b>			
Espesor del núcleo	Es un elemento importante, que determina la rigidez y la formación de las virutas en la broca. El espesor del núcleo se ajusta de acuerdo con la aplicación. <table style="width: 100%; border: none;"> <tr> <td style="border: none;">                 Baja resistencia de corte                  Baja rigidez                  Buena formación de viruta                  Material con buena maquinabilidad             </td> <td style="border: none; text-align: center; vertical-align: middle;"> <b>Delgado ◀••Espesor del núcleo••▶ Grueso</b> </td> <td style="border: none;">                 Gran resistencia de corte                  Alta rigidez                  Mala formación de viruta                  Material de gran dureza,                  taladrado de agujeros cruzados, etc.             </td> </tr> </table>	Baja resistencia de corte Baja rigidez Buena formación de viruta Material con buena maquinabilidad	<b>Delgado ◀••Espesor del núcleo••▶ Grueso</b>	Gran resistencia de corte Alta rigidez Mala formación de viruta Material de gran dureza, taladrado de agujeros cruzados, etc.
Baja resistencia de corte Baja rigidez Buena formación de viruta Material con buena maquinabilidad	<b>Delgado ◀••Espesor del núcleo••▶ Grueso</b>	Gran resistencia de corte Alta rigidez Mala formación de viruta Material de gran dureza, taladrado de agujeros cruzados, etc.		
Margen	La punta determina el diámetro de la broca y tiene la función de guía durante el taladrado. La anchura del margen se determina en función del rozamiento con el agujero taladrado. <b>Mala guía Pequeña ◀••Ancho de margen••▶ Grande Buena guía</b>			
Conicidad del diámetro	Para reducir la fricción dentro del agujero taladrado, la hélice tiene una pequeña conicidad desde la punta hasta el mango. El grado de conicidad se representa normalmente por la reducción del diámetro con respecto de la longitud de la hélice; aproximadamente, 0.04–0.1mm. Se utiliza un valor alto para brocas de alta eficiencia, lo que permite el taladrado de agujeros próximos.			

## ■ GEOMETRÍA DEL FILO DE CORTE Y SU INFLUENCIA

Tal como se muestra en la tabla de abajo, es posible seleccionar la geometría del filo de corte más adecuada para las diferentes aplicaciones. Si se selecciona la geometría de filo de corte más adecuada puede obtenerse la mayor eficacia de mecanizado y la mayor precisión del agujero.

### ● Formas de los filos de corte.

Nombre del afilado	Figura	Características y efecto	Aplicación
Cónica		<ul style="list-style-type: none"> <li>El flanco es cónico y el ángulo de desprendimiento, aumenta hacia el centro de la broca.</li> </ul>	<ul style="list-style-type: none"> <li>Uso general</li> </ul>
Plana		<ul style="list-style-type: none"> <li>El flanco es liso.</li> <li>Fácil afilado.</li> </ul>	<ul style="list-style-type: none"> <li>Principalmente para taladros de diámetro pequeño</li> </ul>
Tres ángulos de flanco		<ul style="list-style-type: none"> <li>Al no haber filo de ataque, se consigue una elevada fuerza centrípeta y un menor sobredimensionado del agujero resultante.</li> <li>Requiere una afiladora especial.</li> <li>Afilado superficial de tres lados.</li> </ul>	<ul style="list-style-type: none"> <li>Para operaciones de taladrado que requieren alta precisión del agujero y precisión de posicionamiento.</li> </ul>
Punto de la hélice		<ul style="list-style-type: none"> <li>Para aumentar el ángulo de ataque cerca del centro de la broca, se realiza un afilado cónico combinado con una hélice irregular.</li> <li>Filo de ataque tipo S con gran fuerza centrípeta y precisión de mecanizado.</li> </ul>	<ul style="list-style-type: none"> <li>Para taladrado que requiere alta precisión.</li> </ul>
Labio radial		<ul style="list-style-type: none"> <li>El filo de ataque está afilado radialmente para dispersar la carga.</li> <li>Gran precisión de mecanizado y rugosidad superficial.</li> <li>En agujeros pasantes disminuye la aparición de rebabas en la base.</li> <li>Requiere una afiladora especial.</li> </ul>	<ul style="list-style-type: none"> <li>Fundición, Aleaciones de aluminio</li> <li>Para placas de fundición.</li> <li>Acero</li> </ul>
Broca de punta central		<ul style="list-style-type: none"> <li>Esta geometría tiene ángulo de punto de dos etapas para mejor concentricidad y una reducción del choque al sacar la pieza de trabajo.</li> </ul>	<ul style="list-style-type: none"> <li>Para taladrado de chapa delgada.</li> </ul>

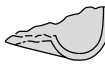

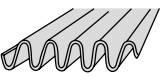

## ■ ESPESOR DEL NÚCLEO

El ángulo de desprendimiento del filo de corte, se va reduciendo a medida que nos acercamos al centro; y se transforma en un ángulo negativo en el filo de ataque. Durante el taladrado, el centro de la broca empuja al material, generando entre el 50–70% del esfuerzo de corte. El espesor del núcleo, es muy importante para la reducción del esfuerzo de corte de una broca, rápida evacuación de las virutas y mejor inicio del taladrado.

Figura	TIPO X	TIPO XR	TIPO S	TIPO N
Características	Se reduce el empuje sustancialmente, y se mejora el proceso inicial. Esto es efectivo cuando el núcleo es mas bien ancho.	El mecanizado es menos efectivo que con el tipo X, pero el filo de corte está más reforzado y se puede aplicar en un mayor tipo de operaciones.	Corte fácil. Forma de mayor utilización.	Es efectivo cuando el núcleo es comparativamente ancho.
Aplicaciones principales	Taladrado en general y de agujeros profundos.	Mayor vida. Taladrado en general y del acero inoxidable.	Taladrado en general de acero fundición y metales no-férricos.	Taladrado profundo.

# CARACTERÍSTICAS Y ESPECIFICACIONES DE LAS BROCAS

## ■ VIRUTAS DE TALADRADO

Tipos de virutas	Forma	Características y facilidad de evacuación
Espiral cónica		Virutas con forma de espiral, cortadas por el filo y curvadas por las hélices. Se producen virutas de este tipo cuando se taladra material dúctil a baja velocidad. Si las virutas se rompen después de varias vueltas, el resultado es satisfactorio.
Paso largo		Virutas de paso largo, evacuadas sin enrollarse. Fácilmente enrollables en la broca.
Abanico		Esta viruta se rompe por acción de la hélice de la broca con la pared del agujero. Se produce cuando el avance es alto.
Segmentada		Viruta de forma cónica-espiral; rota justo antes de que se convierta en una de paso largo, por el roce con la pared del agujero. Excelente evacuación y disposición de las virutas.
Zig-zag		Viruta retorcida y plegada por la forma de la hélice y las características del material. Fácilmente produce aglomeración de virutas en la hélice.
Palpador		Virutas rotas por vibración o cuando el material taladrado es rizado con un pequeño radio. El resultado es comparativamente satisfactorio; pero estas virutas, se pueden aglomerar fácilmente.

# FÓRMULAS PARA TALADRADO

## ■ VELOCIDAD DE CORTE (Vc)

$$V_c = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

**V<sub>c</sub> (m/min)**: Velocidad de corte    **DC (mm)** : Diámetro de broca  
**π (3.14)** : Pi    **n (min<sup>-1</sup>)** : Velocidad del eje principal

\*Divida por 1,000 para cambiar de m a mm.

(Ejemplo) ¿Cuál es la velocidad de corte cuando la velocidad del eje principal es 1350min<sup>-1</sup> y el diámetro de la broca es 12mm ?

(Contestación) Sustituir π=3.14, DC=12, n=1350 en la fórmula.

$$V_c = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \times 12 \times 1350}{1000} = 50.9 \text{ m/min}$$

La velocidad es 50.9m/min.

## ■ AVANCE DEL EJE PRINCIPAL (Vf)

$$V_f = fr \cdot n \text{ (mm/min)}$$

**V<sub>f</sub> (mm/min)** : Velocidad de avance del eje principal (eje Z)  
**fr (mm/rev.)** : Avance por revolución  
**n (min<sup>-1</sup>)** : Velocidad del eje principal

(Ejemplo) ¿Cuál es el avance del eje (Vf) cuando el avance por revolución es 0.2mm/rev. y la velocidad del eje principal es 1350min<sup>-1</sup> ?

(Contestación) Sustituir fr=0.2, n=1350 en la fórmula.

$$V_f = fr \cdot n = 0.2 \times 1350 = 270 \text{ mm/min}$$

El avance del eje es 270mm/min.

## ■ TIEMPO DE TALADRADO (Tc)

$$T_c = \frac{ld \cdot i}{n \cdot fr}$$

**T<sub>c</sub> (min)** : Tiempo de taladrado  
**n (min<sup>-1</sup>)** : Velocidad del eje principal  
**ld (mm)** : Profundidad del agujero  
**fr (mm/rev.)** : Avance por revolución  
**i** : Número de agujeros

(Ejemplo) ¿Cuál es el tiempo necesario para taladrar un agujero de 30mm de longitud en acero aleado con una velocidad de corte de 50m/min y avance de 0.15mm/rev. ?

(Contestación) Velocidad del eje principal  $n = \frac{50 \times 1000}{15 \times 3.14} = 1061.57 \text{ min}^{-1}$

$$T_c = \frac{30 \times 1}{1061.57 \times 0.15} = 0.188$$

$$= 0.188 \times 60 \approx 11.3 \text{ sec}$$

# RUGOSIDAD

## RUGOSIDAD SUPERFICIAL

(Del JIS B 601-1994)

DATOS TÉCNICOS

Tipo	Código	Descripción	Exemple de mesure (Figura)
Rugosidad teórica	Ra	<p>Ra es el valor obtenido en la fórmula siguiente y expresado en micras. Medida aritmética de los valores absolutos de las desviaciones del perfil, en los límites de la longitud básica. Se expresa y=f(x):</p> $Ra = \frac{1}{l} \int_0^l  f(x)  dx$	
Altura máxima	Rz	<p>Rz es la distancia máxima entre la línea de cresta mayor y el valle más profundo, tomados en la dirección de la línea principal de la muestra, y expresada en micras (μm). Nota) Al calcular Rz, es posible encontrar una porción sin ningún valle o cresta excepcionalmente altos o profundos; lo cual puede ser tomado como un defecto.</p> $Rz = R_p + R_v$	
Valor de la rugosidad de diez puntos	RzJIS	<p>RzJIS es la suma de los valores absolutos de las alturas de las cinco crestas (Yp) y de la profundidad de los cinco valles (Yv) más profundos; medidos en dirección vertical de la muestra y expresada en micras (μm).</p> $Rz_{JIS} = \frac{(Y_{p1} + Y_{p2} + Y_{p3} + Y_{p4} + Y_{p5}) + (Y_{v1} + Y_{v2} + Y_{v3} + Y_{v4} + Y_{v5})}{5}$	<p><i>Yp1, Yp2, Yp3, Yp4, Yp5</i> : altitudes de las cinco crestas más altas de la porción correspondiente a la longitud de referencia l. <i>Yv1, Yv2, Yv3, Yv4, Yv5</i> : altitudes de los cinco valles más profundos de la porción correspondiente a la longitud de referencia l.</p>

### RELACIÓN ENTRE RUGOSIDAD TEÓRICA (Ra) Y DESIGNACIÓN CONVENCIONAL (DATOS DE REFERENCIA)

Rugosidad teórica <b>Ra</b>		Altura máxima <b>Rz</b>	Valor de la rugosidad de diez puntos <b>RzJIS</b>	Longitud de muestreo para <b>Rz • RzJIS</b> l (mm)	Símbolo de acabado convencional
Series estándar	Valores de corte λc (mm)	Series estándar			
0.012 a	0.08	0.05s	0.05z	0.08	▽▽▽▽
0.025 a		0.1 s	0.1 z		
0.05 a	0.25	0.2 s	0.2 z	0.25	
0.1 a		0.4 s	0.4 z		
0.2 a		0.8 s	0.8 z		
0.4 a	0.8	1.6 s	1.6 z	0.8	▽▽▽
0.8 a		3.2 s	3.2 z		
1.6 a		6.3 s	6.3 z		
3.2 a		12.5 s	12.5 z		
6.3 a	2.5	25 s	25 z	2.5	▽▽
12.5 a		50 s	50 z		
25 a	8	100 s	100 z	8	▽
50 a		200 s	200 z		
100 a		400 s	400 z		
	—			—	—

\*La correlación entre los tres, es sólo por conveniencia y no es exacta.

\*Ra: La longitud evaluada de Rz y RzJIS, es el valor límite y la longitud del muestreo multiplicadas por 5, respectivamente.

Nota 1) La tabla de arriba es la misma que en el Libro de los Metales con la resistencia a la tracción aproximada en valores métricos y la dureza Brinell por encima del valor recomendado.

Nota 2) 1MPa=1N/mm<sup>2</sup>

Nota 3) Valores entre paréntesis son raramente utilizados como referencia. Esta lista ha sido extraída del libro de normativa JIS de acero.

Nota 1) El tamaño del agujero debe de medirse con mucha precisión ya que el agujero puede cambiar según las condiciones de taladrado, puede no ser apropiado para el roscado posterior, el diámetro de la broca debe corregirse en proporción.

# EN TODO EL MUNDO

## **MITSUBISHI MATERIALS - METALWORKING SOLUTIONS COMPANY UNA UNIÓN PARA EL ÉXITO**

La división Metalworking Solutions de Mitsubishi Materials se dedica al desarrollo y proceso de metales, materiales de corte, recubrimientos y herramientas de precisión. El alto nivel de conocimientos y la experiencia adquirida gracias a los muchos años en la tecnología de fabricación hacen de Mitsubishi Materials uno de los proveedores líderes en el mercado de herramientas de corte de precisión.

La presencia global en el mercado, con oficinas centrales en Japón, Europa, India, Brasil, China, Tailandia, México y USA, así como una amplia red de distribuidores internacionales, garantiza un servicio preciso y completo.

El intercambio de información y tecnología, comunicación abierta y las crecientes uniones más allá de los límites garantizan el máximo rendimiento y el éxito sostenible del cliente.
